

RESEARCH STUDY FOR CHILDREN AGES 15 MONTHS-6 YEARS

receiving treatment for autism or typically developing

Study Information

This study will examine if a new investigational medical device, called the Earlipoint™ Assessment for Autism Spectrum, can be used to assess a child's treatment progress over time. The device detects the presence and severity of autism spectrum disorder and related developmental delays.

The Earlipoint™ Evaluation for Autism Spectrum (the device) tracks where children are looking as they watch videos on a screen. This shows us how typically developing children and children with autism visually explore the world differently.

What will my family be asked to do?

- Review, sign, and return an Informed Consent document that explains the study details
- Attend seven (7) study visits over a 6-month period with your child
- Your child will be asked to watch videos featured on the Earlipoint™ device
- Researchers will observe and evaluate your child's developmental status at three (3) of the visits

How long will this take?

- Visits are completed once a month for six (6) months
- Most visits take less than one (1) hour to complete
- Visits #1, #4, and #7 will take up to four (4) hours

I would like to learn more. What do I do next?

Contact the study coordinators, Julia Doretti and Kiva Kelly, for more information.

Emails: jmd627@drexel.edu | kdk67@drexel.edu

Phone Number: 267-433-8002

Principal Investigator: Giacomo Vivanti, PhD

YOUR CHILD MAY BE ELIGIBLE IF THEY:

- ✓ Are 15-78 months of age
- ✓ Have an ASD diagnosis and is enrolled in treatment or is typically developing
- ✓ Are physically able to sit in a chair, highchair, or booster seat at a table and watch age-appropriate videos on a screen
- ✓ Have normal to corrected-to-normal vision and hearing

Will I receive anything for participating?

- You will receive a total of **\$340** across the entire study (paid in increments of \$40 or \$60 after each visit)
