SEGREGATION IN LATIN AMERICA

- **Segregation:** social differentiation of the urban space or spatial concentration of a social group.
- The pattern of **spatial segregation** in Latin American cities has some distinguishable features (Sabatini;2003):
 - Lower-income groups occupy peripheral, homogenous and poorly-serviced areas
 - High-income groups are clustered in one area of the city, frequently linked to the city's downtown.

In this study, urban segregation is the degree to which people from two or more SES live separately from one another, at the different spatial units of the city.

AIMS

- To compare participant's spatial trajectories in four Ciclovía Recreativa programs in Latin America (Bogotá, Mexico City, Santiago de Cali, and Santiago de Chile) according to socioeconomic characteristics and urban segregation of these cities
- To assess the relationship between Ciclovía Recreativa participants' PA levels and sociodemographic characteristics.

Methods

- Harmonization data from 4 longitudinal surveys of Ciclovia participants
 - Bogotá: 1,001 adults (18-64 years); 2015
 - Mexico City: 721 adults (18-64 years); 2017-2018
 - Santiago de Cali: 1,159 adults (18-64 years); 2019
 - Santiago de Chile: 401 adults (18-64 years); 2016
 - Total of **3,282** adult participants
 - Variables: sociodemographic, health, and PA information, PA Behaviors and program usage
- Geocoding and trajectories → Information on participants' trajectories within the program
 - Origin:
 - Bogotá: participant's home address or nearest intersection to home address
 - Santiago de Cali, Santiago de Chile: the nearest intersection to participant's home addresses
 - México city: the nearest intersection to the location where participants were interviewed.
 - Destination:
 - Bogotá: address of the location where participants were interviewed in the Ciclovia.
 - Santiago de Chile: the nearest intersection to the location where participants were interviewed
 - Mexico city, Santiago de Cali: the farthest point participants intended to reach during their journey.
 - Trajectories: the shortest path distance through the street network (ArcGIS®).

Methods- Urban Segregation

Urban segregation index (Theil index or Entropy index range 0-1):

- It allowed to characterize the extent to which populations of different SES (i.e. low, middle and high level) are evenly distributed throughout geographic units (i.e. neighborhoods, localities, census zones).

- Bogotá and Santiago de Cali: neighborhoods; the classification institutionalized by the DANE
- Mexico city: localities; Marginalization index (CONAPO)
- Santiago de Chile: census areas; socio-material territorial indicator

■ Average SES per traveled kilometer

- Within the trajectory, we the average SES per traveled kilometer of all participants' trajectories.
- To quantify the changes in the socioeconomic characteristics of urban environments during participants' trajectories

RESULTS

City characteristics

Characteristic	Bogotá	Mexico City	Santiago de Cali	Santiago de Chile
Total population	7,878,783	8,918,653	2,470,852	7,112,808
Population density (people/Ha)	21,916	11,247	17,691	9,632
GINI coefficient	0.50	0.53	0.46	0.49
Homicide rate (per 100,000 people)	14.30	16.00	51.30	4.90
Green area per capita (m ² /inhabitant)	3.90	5.40	5.93	4.83
Motorization rate (per 1,000 inhabitants)	247.00	544.05	251.28	254.67
Urban travel delay index	0.82	0.57	0.57	0.34

Ciclovía Recreativa program characteristics

Characteristic	Bogotá	Mexico City	Santiago de Cali	Santiago de Chile
Name	Ciclovía de Bogotá	Muévete En Bici	Ciclovida de Cali	CicloRecreoVía
Year of inauguration	1974	2007	1996	2006
Participants per event	600,000-1,750,000	21,000	30,000	40,000
Events per year	72	37	93	51
Length (Km)	127	55	60	38
Source of funding	Public and Private	Public	Public	Public and Private
Program average cost/year (USD millions)	2.4	1.0	1.65	1.06

Participant's sociodemographic characteristics

High SES	9.25		14.00		4.75
					3.75

Conclusions

- The Ciclovía Recreativa program can be a socially inclusive program in highly unequal and segregated urban environments.
- In addition to providing a space for PA, the Ciclovía program works as a venue that facilitates physical proximity, exposure to new communities, and interactions between different socioeconomic groups.
- SES integration through city trajectories differed by city. Bogotá and Santiago de Cali programs exhibit larger integration compared to the Mexico city and Santiago de Chile program.
- This study illustrates the importance of implementing public space usage policies, as well as built environment changes in urban settings, to have a population-based impact in relevant aspects of public health.

THANK YOU!

The Salud Urbana en América Latina (SALURBAL)/ Urban Health in Latin America project is funded by Wellcome Trust [205177/Z/16/Z].
