## Introduction

This report serves as a repository of the baseline community indicator data compiled by the Cedar Campus Evaluation team. It can be used as a snapshot of needs and assets of the PHMC Public Health Campus on Cedar (Cedar Campus) catchment area during the first few years of the Campus implementation. All the data presented in this report are publicly available but were compiled and presented for the Cedar catchment geographic area by the Cedar Campus evaluation team.

## Background

The baseline evaluation was a collaborative effort between PHMC's Research & Evaluation Group (R&E) and a team from the Urban Health Collaborative at Drexel University's Dornsife School of Public Health (Drexel) conducted from November 2022 through March 2025 and funded by the Independence Blue Cross Foundation (IBX). The Drexel-PHMC evaluation team engaged with stakeholders in its planning year to co-create an evaluation design, followed by a baseline data collection year. All evaluation work included input from the Cedar Campus Evaluation Committee, which included community individual and organization representatives, as well as members of the PHMC and Drexel evaluation teams. This report was prepared by the Drexel team in consultation with the R&E team.

The indicators presented in this report were selected through an iterative process whereby the Cedar Campus Evaluation Committee discussed data priorities, the feasibility of accessing different data sets, and the best ways to present these data for collective decision-making and evaluation. Members of the evaluation committee were invited to complete a community indicator priority survey, the results of which were used to determine the indicators included in this report. This information was originally intended to be presented as an interactive dashboard. However, with the end of funding in early 2025, we have converted the data into a static format that can be shared without the need for ongoing maintenance or web hosting.

## Uses for Community Indicator Data

This report aims to provide baseline data to support the development of programming and evaluation activities for the Cedar Campus. Community-level data can be used to identify service needs, underserved populations or areas, and health trends within Cedar's catchment area. Over the longer term, these data can also be used to assess the impact of Cedar campus programming on community-wide health outcomes. Listed below are some potential uses for community indicator data in support of Cedar Campus's evaluation moving forward:

- To identify needs in the Cedar Campus catchment area that the Campus may be able to address through its existing or future services.
- To provide context about the communities surrounding Cedar Campus to aid in decision-making about how best to tailor services. This includes identifying variations between specific neighborhoods within the Cedar Campus catchment area.

- To identify, account for, and address changes over time in sociodemographic and health trends in the Cedar Campus catchment area.
- To, along with patient data from Cedar Campus service providers, assess whether the use of Cedar services in a particular area or by a certain population is associated with community-level changes in health outcomes as part of Cedar Campus evaluation efforts.
- To assess the possibility of unintended outcomes associated with Cedar programming (i.e., changes in income or educational attainment).

## About This Report

In this report, you will find maps and data tables for the following area-level community indicators for the Cedar Campus' catchment area:

- **Healthcare Facilities**
- **Demographic and Economic Indicators**
  - Percent of Population with a High School Degree or More
  - Median Household Income
  - Percent of Population Over 65
  - Percent of Population Under 18
  - Percent of Population using Medicaid
- **Health Indicators**
  - Coronary Heart Disease
  - Diabetes
  - High Blood Pressure
  - Poor Self-Rated Mental Health
  - Poor Self-Rated Physical Health
  - Poor Self-Rated General Health

Estimates for the prevalence of each indicator are first presented at the catchment- and city-levels.

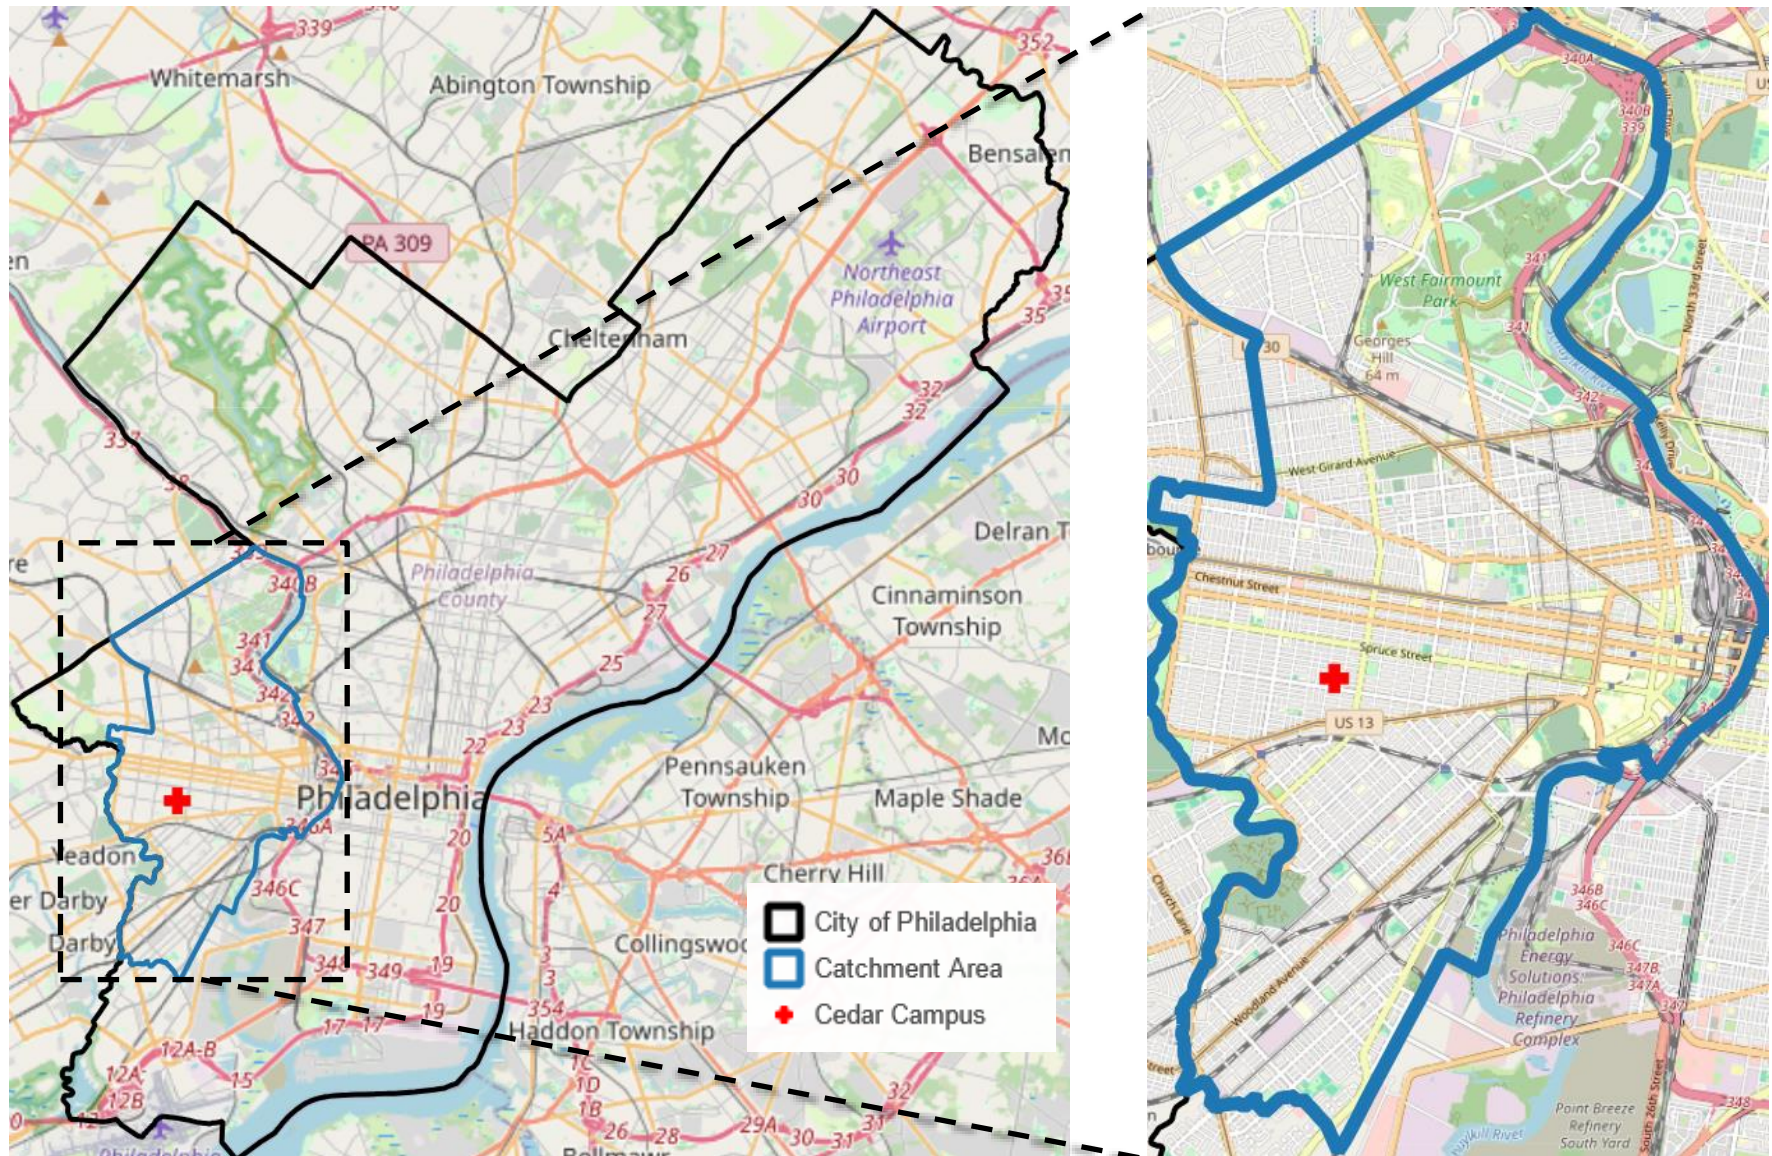

Data for each demographic, economic, and health indicator are presented for three different types of areas:

- **Cedar Campus Catchment Area** is defined as ZIP codes 19131, 19139, 19104, 19143, and 19142. See the **Considerations and Limitations** section below for information on how we combined estimates for these ZIP codes to create catchment area-level estimates.
- **ZIP Code Tabulation Areas (ZCTAs)** are areas created by the U.S. Census Bureau to approximately represent US Postal Service ZIP codes ([U.S. Census Bureau, 2023](#)). ZCTAs are created so that each block is in the same ZCTA. For a very small number of blocks that include addresses in different ZIP codes, this means the ZCTA does not exactly correspond to the ZIP code. Because this happens so rarely, we have labeled ZIP codes in the maps and tables even though they are technically ZCTAs.

- **Census Tracts** are areas designed by the U.S. Census Bureau based on population ([U.S. Census Bureau, 2022](#)). They are smaller than ZCTAs and therefore are often a better representation of neighborhoods. They generally have a population size between 1,200 and 8,000 people, with an optimum size of 4,000 people. Because they are based on population rather than land area, census tracts in densely populated urban areas cover less land area than census tracts in suburban or rural areas. Usually census tracts lie within ZIP codes, but there are some census tracts that overlap multiple ZIP codes. In these cases, we assigned the ZIP code that has the largest overlapping land area with the census tract. Each map and table of census tracts shows which ZIP codes the census tracts are in.

## Catchment Area

The following maps show the outlines of Philadelphia (solid black line) and the Cedar Campus catchment area (thick blue line), as well as the location of Cedar Campus (red cross). The catchment area includes 5 zip codes: 19131, 19139, 19104, 19143, and 19142.

## Indicator Definitions

The table below shows the definition and source of each demographic, economic, and health indicator. The data sources are described further in the section below.

Indicator Name	Definition	Source
Healthcare Facilities	Locations of health care facilities in the city of Philadelphia	OpenDataPhilly – Health Centers Data  Health Resources and Services Administration (HRSA)  Centers for Medicare and Medicaid Services (CMS) (via ArcGIS Living Atlas)
Coronary Heart Disease	Percent of adults with heart disease	CDC PLACES
Diabetes	Percent of adults with diabetes	CDC PLACES
General Health	Percent of adults who rated their health as fair or poor	CDC PLACES
High Blood Pressure	Percent of adults who have high blood pressure/hypertension	CDC PLACES
High School Graduates	Percent of people 25 and older who have a high school degree or more	U.S. Census Bureau
Median Household Income	Median household income	U.S. Census Bureau
Physical Health	Percent of adults who rated their physical health as fair or poor for 14 or more days	CDC PLACES
Population Over 65	Percent of people over the age of 65	U.S. Census Bureau
Population Under 18	Percent of people under the age of 18	U.S. Census Bureau
Population Using Medicaid	Percent of the population enrolled in Medicaid or another means-tested public insurance program	U.S. Census Bureau

## Data Sources

### CDC PLACES

PLACES is a dataset produced by the Centers for Disease Control and Prevention (CDC) that uses American Community Survey (ACS) and data from the Behavioral Risk Factor

Surveillance System (BRFSS) to estimate the prevalence of a number of indicators at the census tract and ZIP code level.

#### **U.S. Census Bureau**

This dataset uses 5-year ACS estimates to provide demographic data for the catchment area. The ACS estimates are valid for any of the 5 years (i.e. ACS 5 Year 2017-2022 is a valid estimate for all years between 2017-2021). In this report if ACS data has a year it refers to the midpoint year of the 5-year window (i.e. 2017-2021 is reported as 2019). These are provided as a snapshot of the years. The Census Bureau does not recommend using 5-year ACS data to compare trends over time.

#### **OpenDataPhilly – Health Centers Data**

The repository for publicly available data for the city of Philadelphia. The dataset contains a list of primary care health centers in the city.

#### **Health Resources and Services Administration**

Location of and type of services provided by Federally Qualified Health Centers.

#### **Centers for Medicare and Medicaid Services**

Contains information on all hospitals that are registered with Medicaid and Medicare.

See the Appendix for a full list of sources and other citations.

### **Considerations and Limitations**

- This report includes data ranging from 2015 to 2021, but the exact years of data available differ for different indicators. The year of the data being presented is shown by a heading above each table or map.
- Usually census tracts lie within ZIP codes, but there are some census tracts that overlap multiple ZIP codes. In these cases, we assigned the ZIP code that has the largest overlapping land area with the census tract.
- Data were not available for all areas for all indicators. Missing data are shown by a “Missing” value in the tables and dark grey shading in the maps.
- Data for city-level estimates were pulled from the Census data tables or the CDC PLACES data portal as available. For indicator data from the Census, catchment-level area estimates were made using the raw counts provided. For indicator data from CDC PLACES (which does not provide raw counts) we created catchment area estimates by pulling the total population aged 18+ from the census for each ZCTA, multiplying by the prevalence given by CDC PLACES for each indicator and ZCTA, summing the products and the total population 18+ for the catchment area for each year, and then dividing the prevalence estimate by the total population aged 18+.
  - Mental health data was available only at the census tract rather than ZCTA level. This added complication because census tract boundaries change over

time. To address this issue, we used the Longitudinal Tract Database 2020-to-2010 crosswalk<sup>1</sup> to convert the U.S. Census data estimates of the total population aged 18+ from 2020 census tracts to estimates using the 2010 census tracts for years 2018-2021. The crosswalk allowed us to match what we felt was the best estimate of the target population in that year, which were available in 2020 census tracts, to the CDC Places prevalence estimates that were available in 2010 census tracts.

- Some of the data come from the American Community Survey (ACS), which is conducted by the U.S. Census Bureau. To provide stable estimates, we used 5-year ACS data. This means that each year in our data is an average of 5 years of data. For example, an indicator using ACS data that is labeled “2019” is actually the average of data 2017-2021. Because of this, the indicators for different years contain overlapping data (e.g., “2019” includes 2017-2021, and “2020” includes 2018-2022). For this reason, the Census Bureau recommends that these estimates should not be compared to look at trends over time.
- Some of the data come from the Center for Disease Control and Prevention’s (CDC’s) PLACES database. The CDC does not recommend using the PLACES data for directly evaluating programs. The data provided in this report is intended to be used to provide contextual baseline information about the areas in the Cedar Campus catchment area, not as outcome measures for evaluating the Campus. The list of hospitals from the CMS will only include hospitals that receive federal funding from the Medicare and Medicaid programs. This likely includes a large majority of hospitals in the area but it is not necessarily exhaustive.

## Additional Resources

The City of Philadelphia maintains several dashboards and reports with additional helpful health-related information about Philadelphia.

- **PhilaStats** is a dashboard with information on vital statistics (population, mortality, and births).
  - <https://philadelphiapublichealth.shinyapps.io/philastats/>
- **Health of the City** report has information on many topics including social determinants of health, infectious diseases, chronic diseases, mental health, gun violence, and healthcare.
  - <https://www.phila.gov/documents/health-of-the-city/>

---

<sup>1</sup> This crosswalk was created by Stephen Francisco and Steve Melly at Drexel University’s Dornsife School of Public Health Urban Health Collaborative, with funding supported by the MESA Neighborhoods & Aging ancillary study. The MESA Neighborhoods and Aging ancillary study is funded by the National Institute on Aging, National Institutes of Health (R01AG072634, PI: Hirsch).

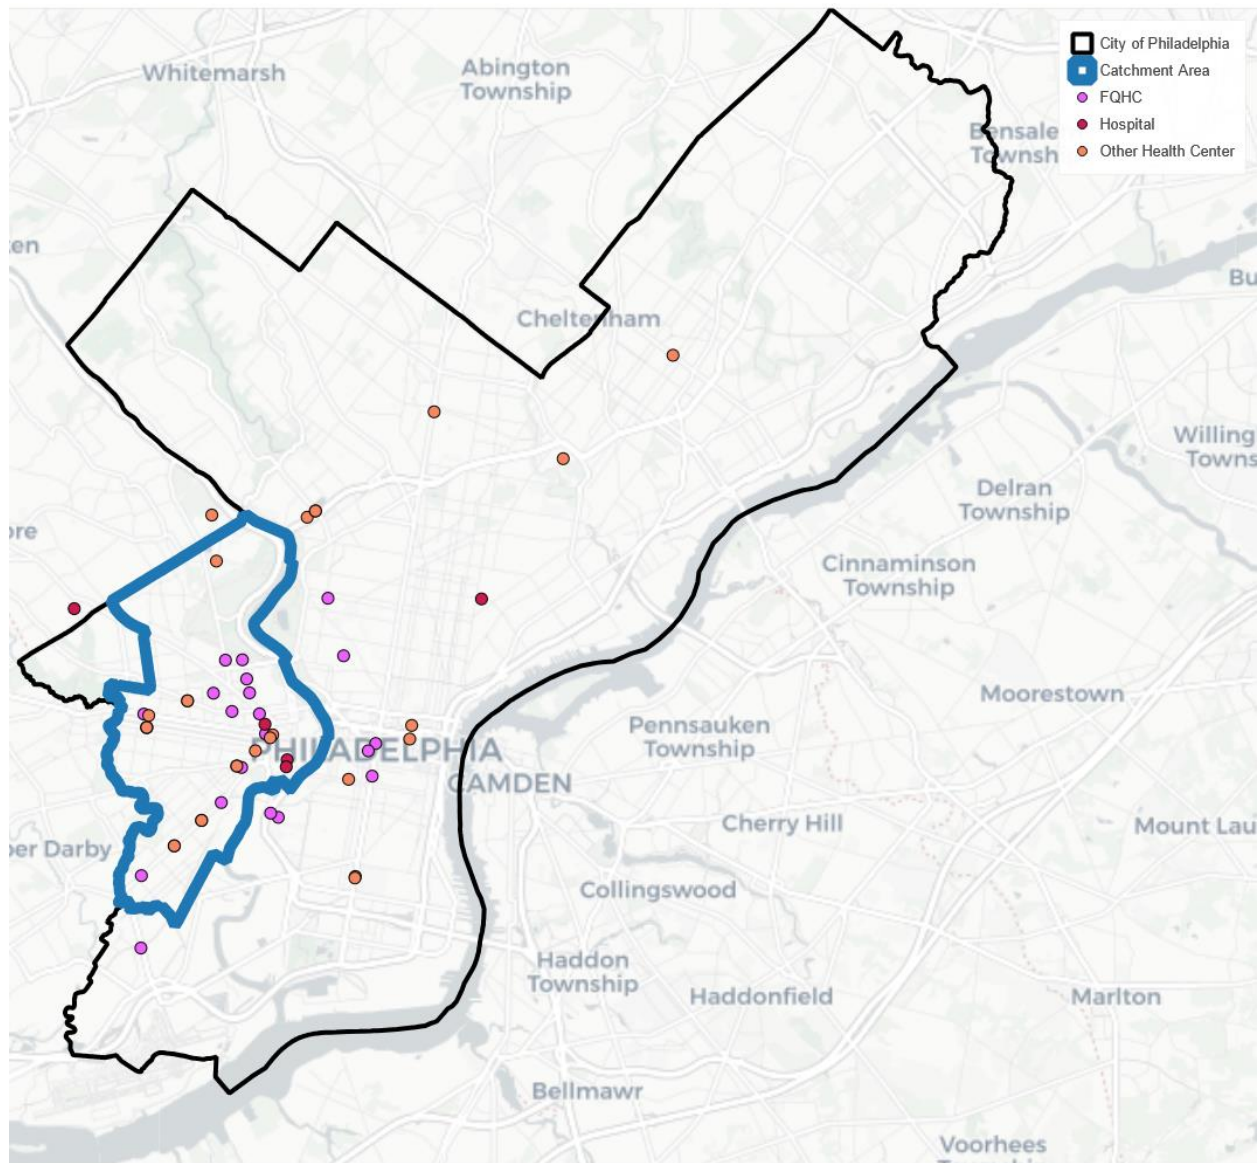

- **Philadelphia District Attorney's Office Public Data Dashboard** uses police, court, and other data streams to provide datasets related to the criminal legal system.
  - [Philadelphia DAO Data Dashboard](#)

## Healthcare Facilities

The map below shows the locations of hospitals, Federally Qualified Health Centers (FQHC), and other healthcare centers. This data was pulled from the Medicaid and Medicare registries, FQHC databases, and from data provided by the City of Philadelphia.

## Demographic and Economic Indicators

### Percent of Population with a High School Degree or More

Individuals who do not graduate high school are more likely to self-report overall poor health. They also more frequently report suffering from at least 1 chronic health condition — for example, asthma, diabetes, heart disease, high blood pressure, stroke, hepatitis, or stomach ulcers — than high school graduates ([Healthy People 2030](#)).

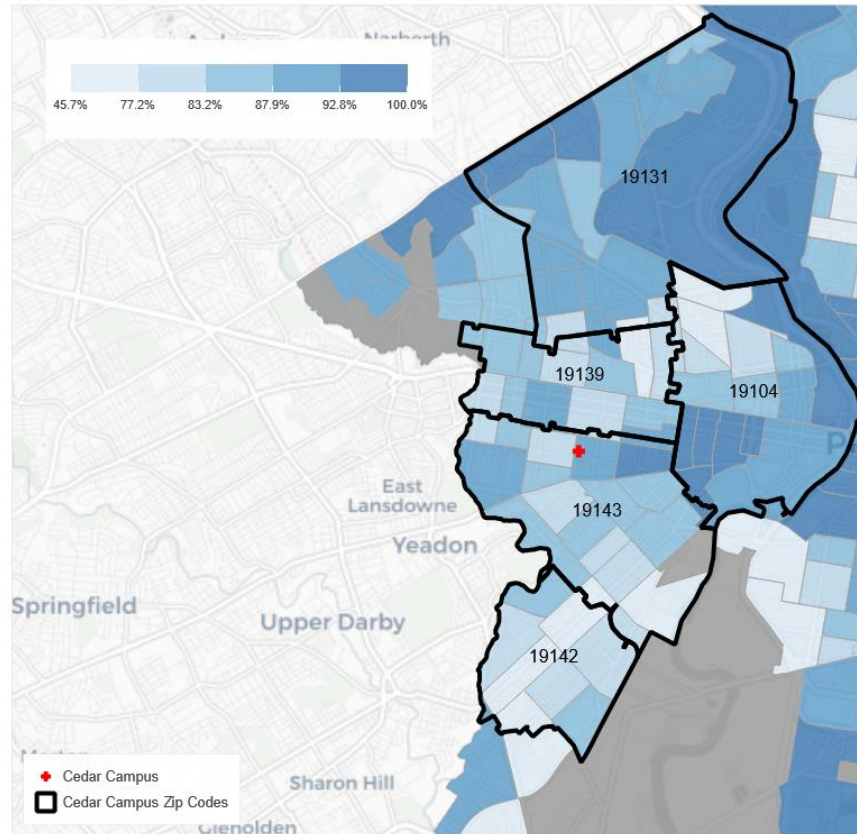

The maps and tables below show the estimated percentages of adults aged 25 years or older in the designated areas who report having graduated high school.

### Median Household Income

Income allows families and individuals to purchase health insurance and medical care but also provides options for healthy lifestyle choices. Families and individuals made vulnerable by poverty are most likely to live in unsafe homes and neighborhoods, often with limited access to healthy foods, employment options, and quality schools ([County Health Rankings & Roadmaps, n.d.](#)).

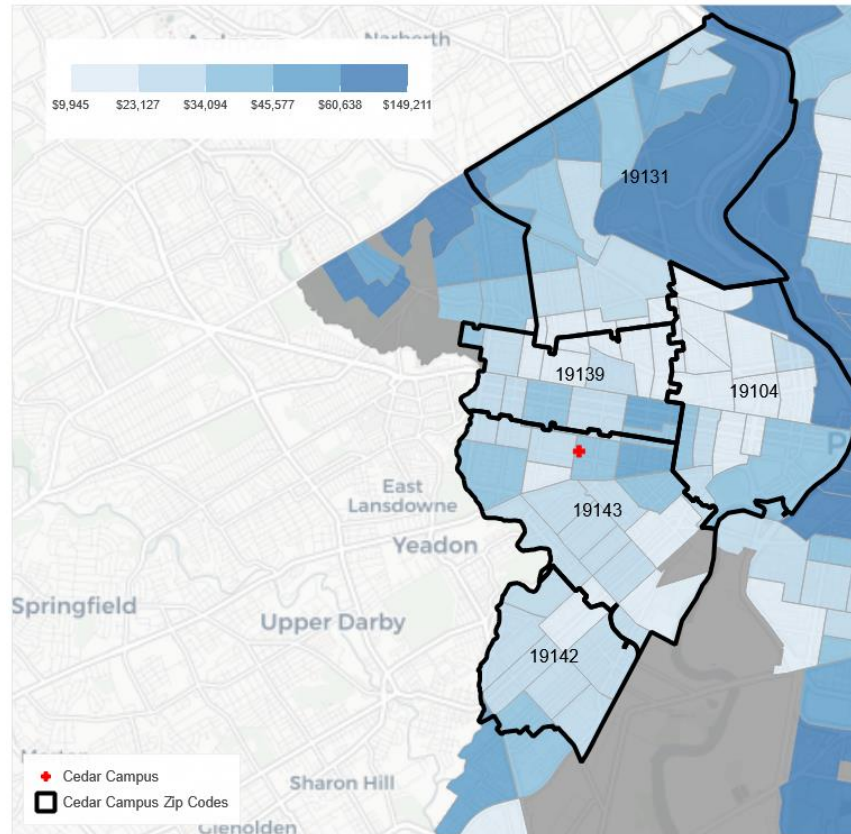

The maps and table below show the estimated median household incomes in the designated areas. Median household income is determined by identifying the income level where half the households in the area earn more and half earn less.

## Health Indicators

### Coronary Heart Disease

Coronary heart disease (also called ischemic heart disease) is caused by plaque buildup on the arteries. These blockages can limit the amount of blood and oxygen the heart receives causing chest pain or angina. Coronary heart disease may present as an acute myocardial infarction (heart attack) which happens when the blood flow to a part of the heart is blocked by plaque. Timely, effective treatment for heart attacks can reduce the risk of long-term disability and death.

The maps and tables below show the estimated percentages of adults (people aged 18 years or older) in the designated areas who self-report having been diagnosed with coronary heart disease by a physician. It is important to note that this measure is based on respondent recall and may underestimate true prevalence.

## Diabetes

With diabetes, a person's body doesn't make enough insulin or can't use it as well as it should. When there isn't enough insulin or cells stop responding to insulin, too much blood sugar stays in the bloodstream. Over time, that can cause serious health problems, such as heart disease, vision loss, and kidney disease ([CDC, n.d.](#)).

The maps and tables below show the estimated percentages of adults (people aged 18 years or older) in the designated areas who self-report being told by a doctor or other health professional that they have diabetes (other than diabetes during pregnancy). As self-awareness of having diabetes is low, the prevalence of diabetes may be underestimated.

## High Blood Pressure

According to the American College of Cardiology/American Heart Association (ACC/AHA) 2017 hypertension guideline, hypertension (high blood pressure) is defined as a blood pressure  $\geq 130/\geq 80$  mmHg (**Whelton et al., 2017**). High blood pressure is the number one modifiable risk factor for stroke. In addition to stroke, high blood pressure also contributes to heart attacks, heart failure, kidney failure, and atherosclerosis

The maps and tables below show the estimated percentages of adults (people aged 18 years or older) in the designated areas who report ever having been told by a doctor, nurse, or other health professional that they have high blood pressure. Individuals who were told they had high blood pressure only during pregnancy and those who were told they had borderline hypertension are not included. This measure does not account for those with undiagnosed high blood pressure, is subject to recall, and thus likely underestimates actual prevalence.

### Poor Self-Rated Mental Health

Mental health problems, operationalized here as “frequent mental distress”, are negatively associated with life expectancy and positively associated with behavioral and metabolic risk factors.

The maps and table below show the estimated percentage of adults (people aged 18 years or older) who report that their mental health (including stress, depression, and problems with emotions) was not good for 14 or more days during the past 30 days.

### Poor Self-Rated Physical Health

Physically unhealthy days, one of the CDC's health-related quality of life measures, is defined as a person's perceived physical health over time. The CDC's frequent physical distress measure is used to identify individuals with more severe or chronic physical health problems in the previous month.

The maps and tables below show the estimated percentage of adults (people aged 18 years or older) who reported 14 or more days, during the past 30 days, that their physical health (including physical illness and injury) was **not good**.

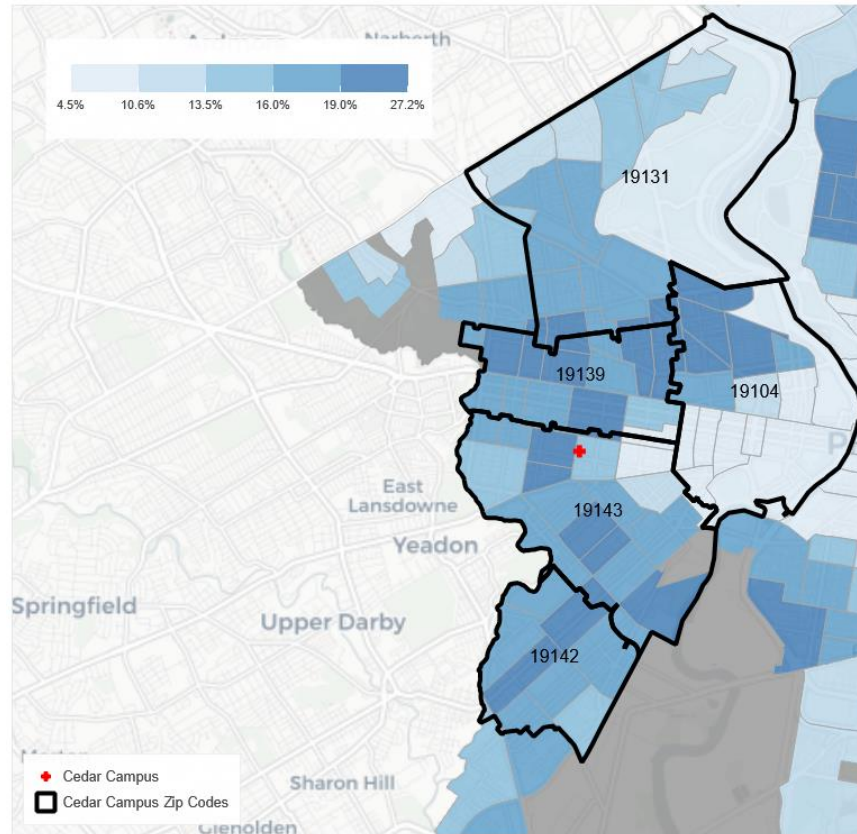

<https://www.cdc.gov/places/measure-definitions/health-status.html>

### Poor Self-Rated General Health

Health status is a measure of how people perceive their health and is considered a good global assessment of a person's well-being. Furthermore, it is a predictor of important health outcomes including mortality, morbidity, and functional status.

The maps and tables below show the estimated percentages of adults (people aged 18 years or older) in the designated areas who report their general health status as “fair” or “poor”.

<https://www.cdc.gov/places/measure-definitions/health-status.html>
